Genomic data visualization and interpretation

Malachi Griffith, Zachary Skidmore, Obi Griffith
Workshop on Genomics
May 27, 2022
Český Krumlov, Czech Republic

My background: Translational genomics and personalized oncology

griffithlab.org

Why do we create visualizations of genomic data?

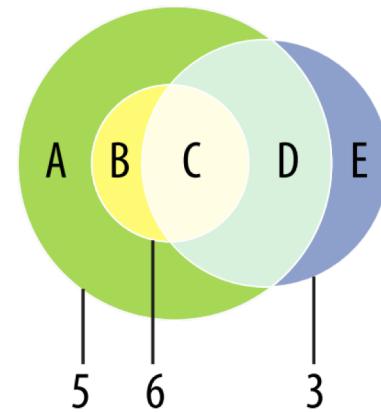

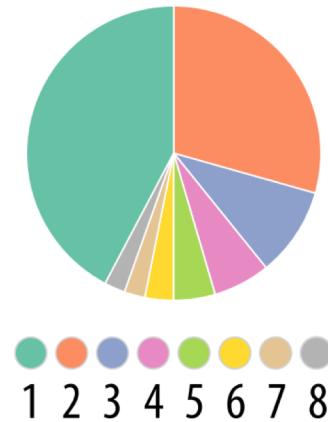

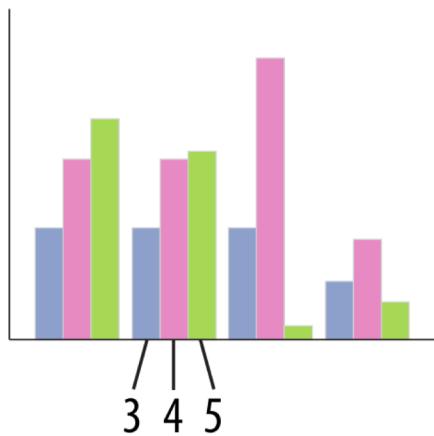

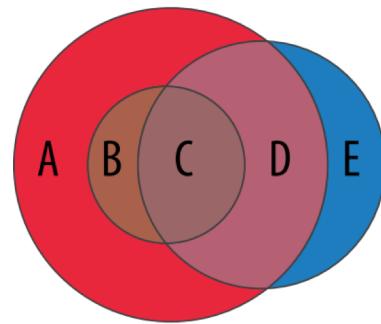

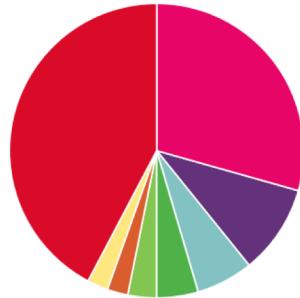

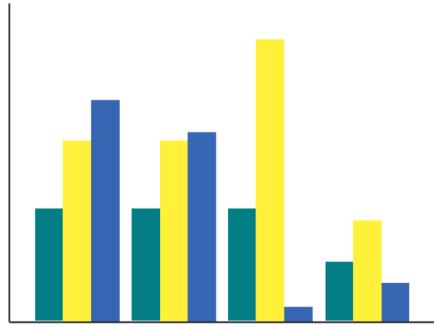

- Data exploration and interpretation of results
 - QC analysis
 - Understanding whether/how an experiment worked
 - Discovery
- Communication
 - Slides for presentations
 - Figures for publications

Fundamentals of data visualization

Fundamentals of data visualization

- Where to learn more about the art and science of visualization:
 - Collection of 40 Nature Methods articles on data visualization:
[“Points of View” Articles](#)
 - [Visual design principles lecture](#)

Which series is more effective (top or bottom)?

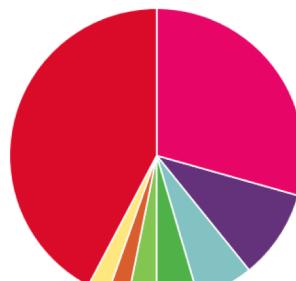

Which series is more effective (top or bottom)?

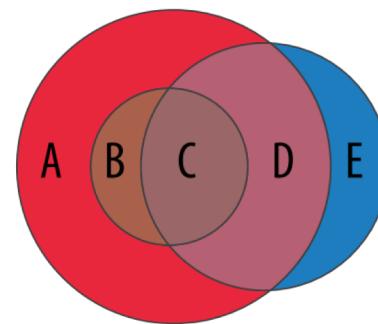

one color dominates

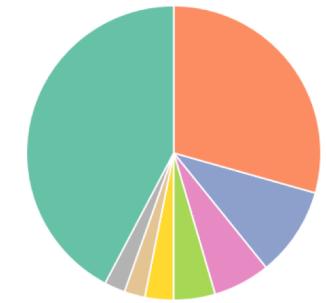

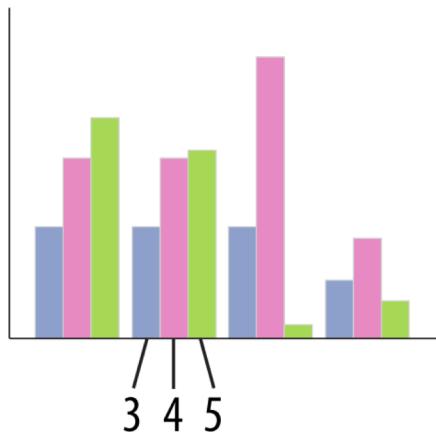

difficult to distinguish

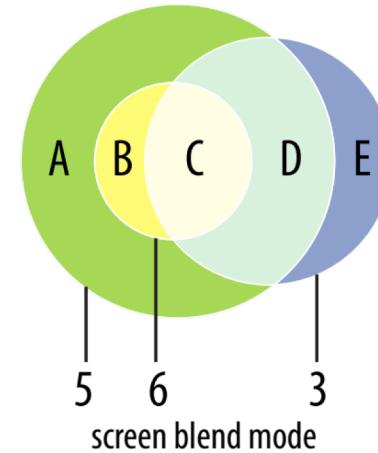

murky

recolored with Brewer palettes

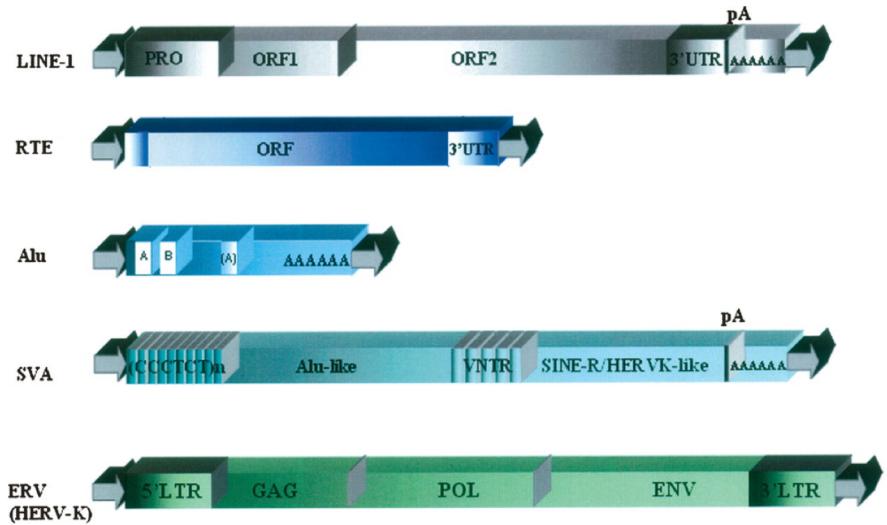

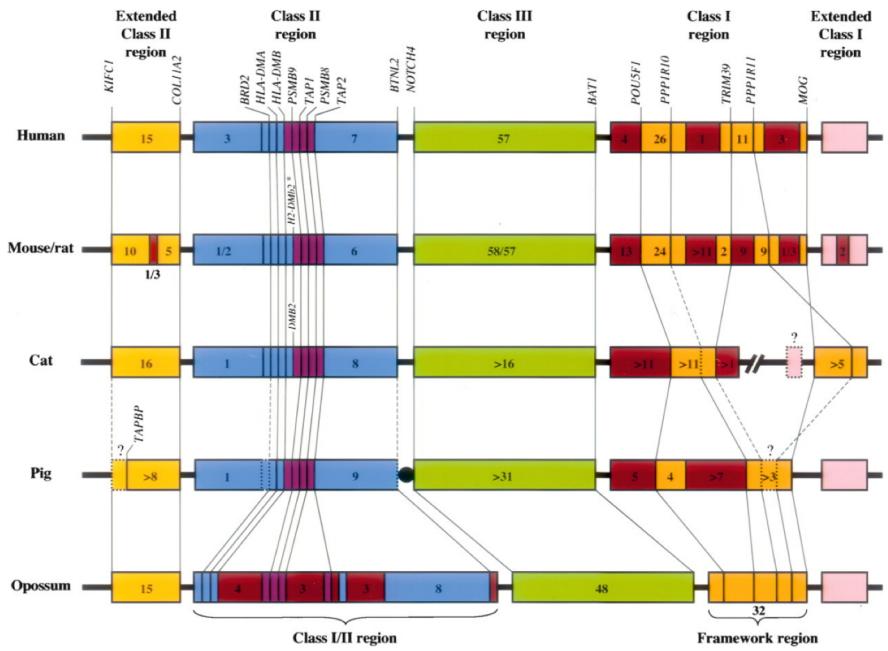

set2
1 2 3 4 5 6 7 8

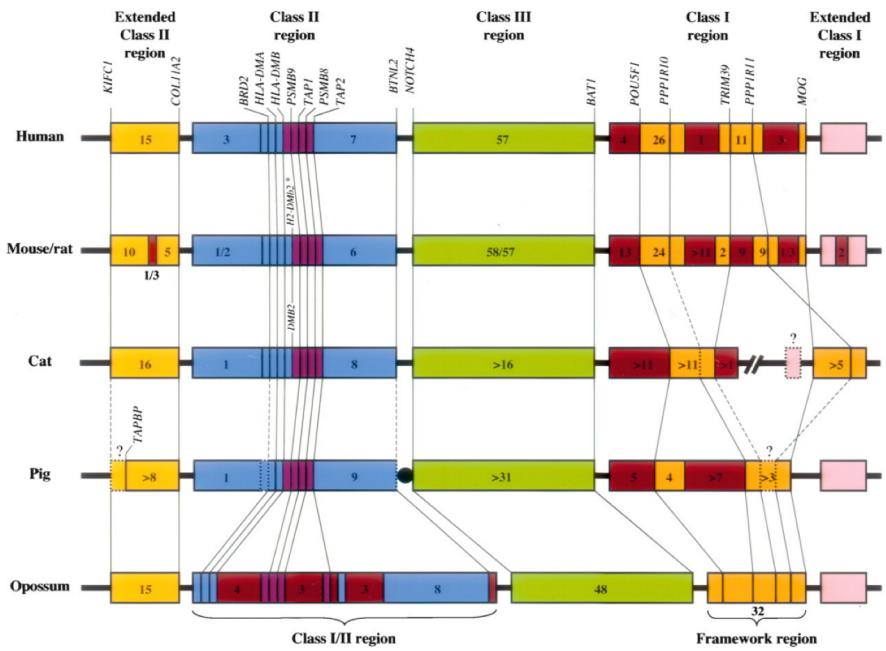

5 6 3
screen blend mode

Which is more effective (left or right?)

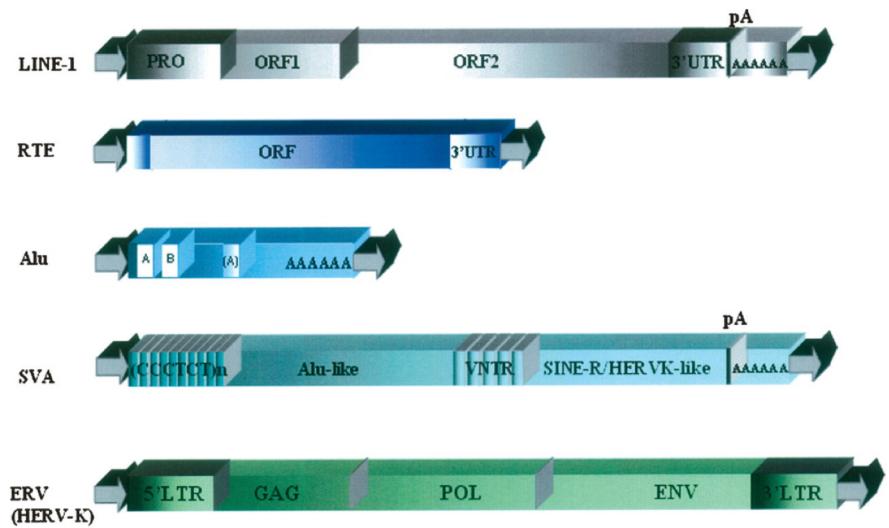

Which is more effective (left or right?)

Excellent organization and consistency. Vertical lines cue continuity. Good use of color.

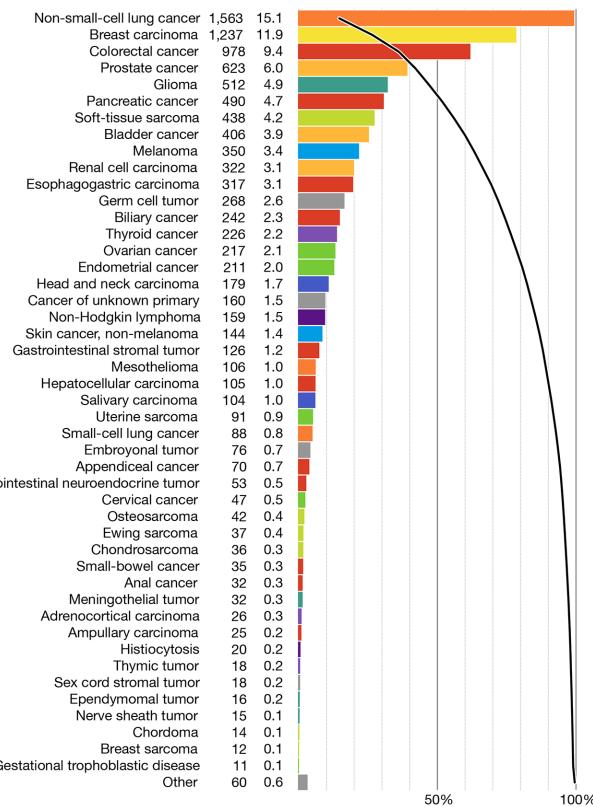

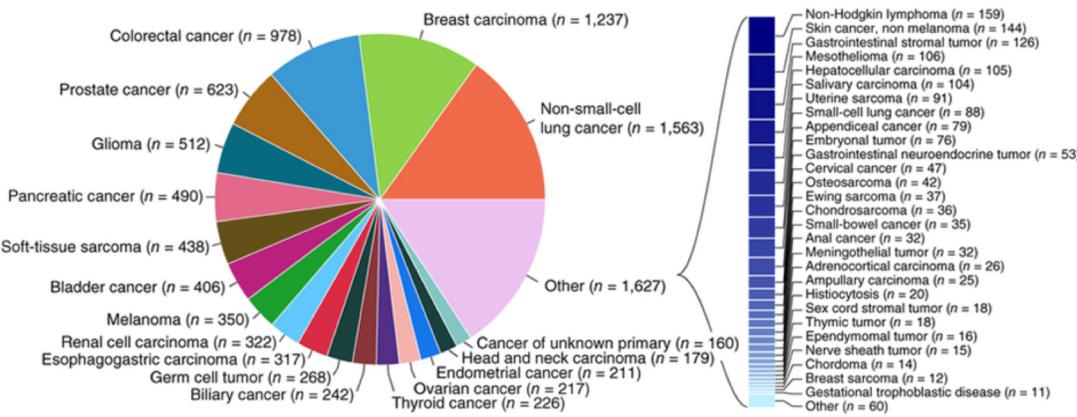

Samollow, P.B., The opossum genome: insights and opportunities from an alternative mammal. *Genome Res.* 2008. 18(8): p. 1199-215.

Chartjunk plentiful. Screaming ornamental and redundant elements. Text inconsistent and illegible.

Gentles, A.J., et al., Evolutionary dynamics of transposable elements in the short-tailed opossum *Monodelphis domestica*. *Genome Res.* 2007. 17(7): p. 992-1004.

Which is more effective (left or right?)

When to use a pie chart

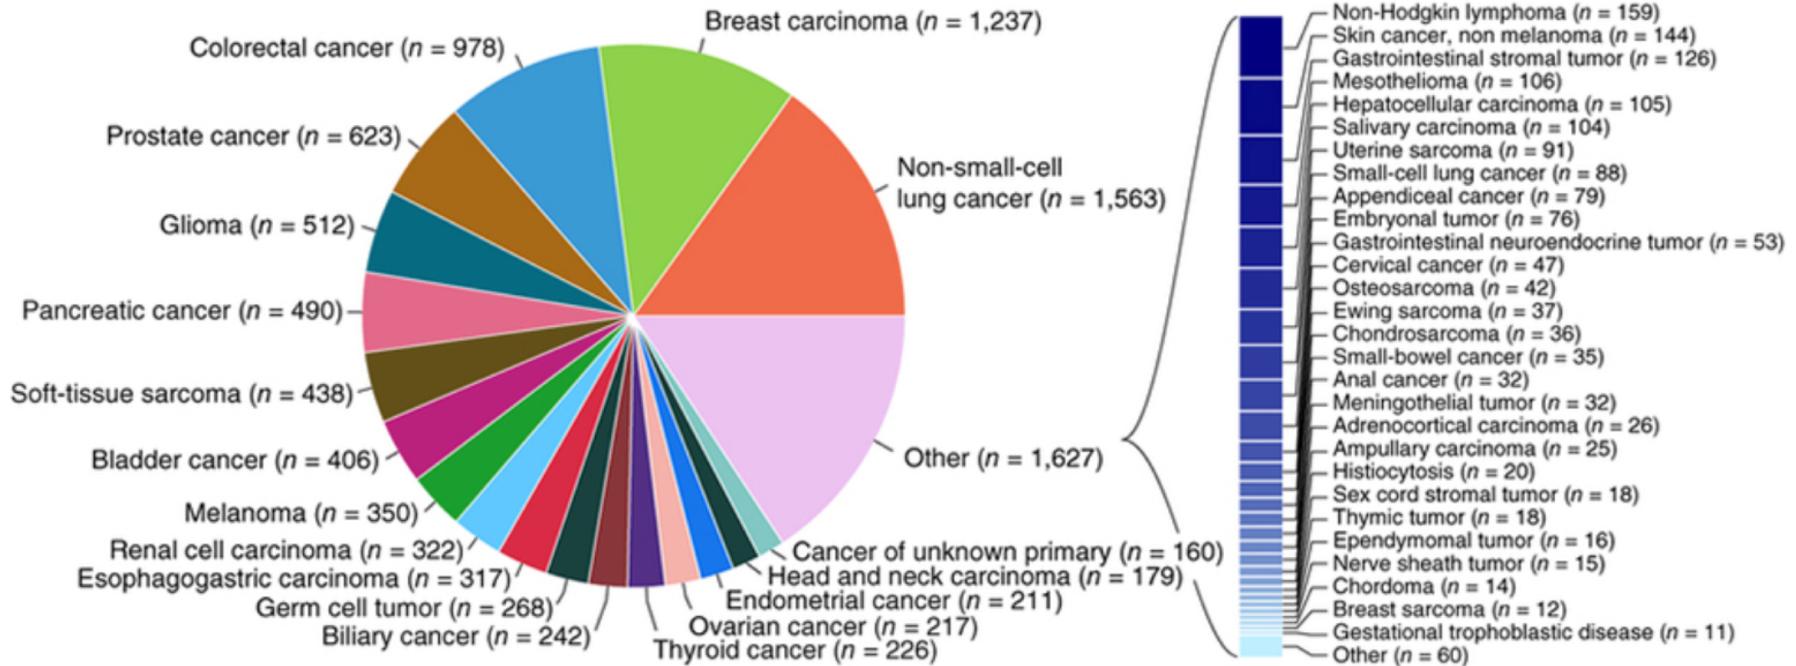

Pie charts are good at precisely showing 1:3 proportions

...but not if the slice is rotated

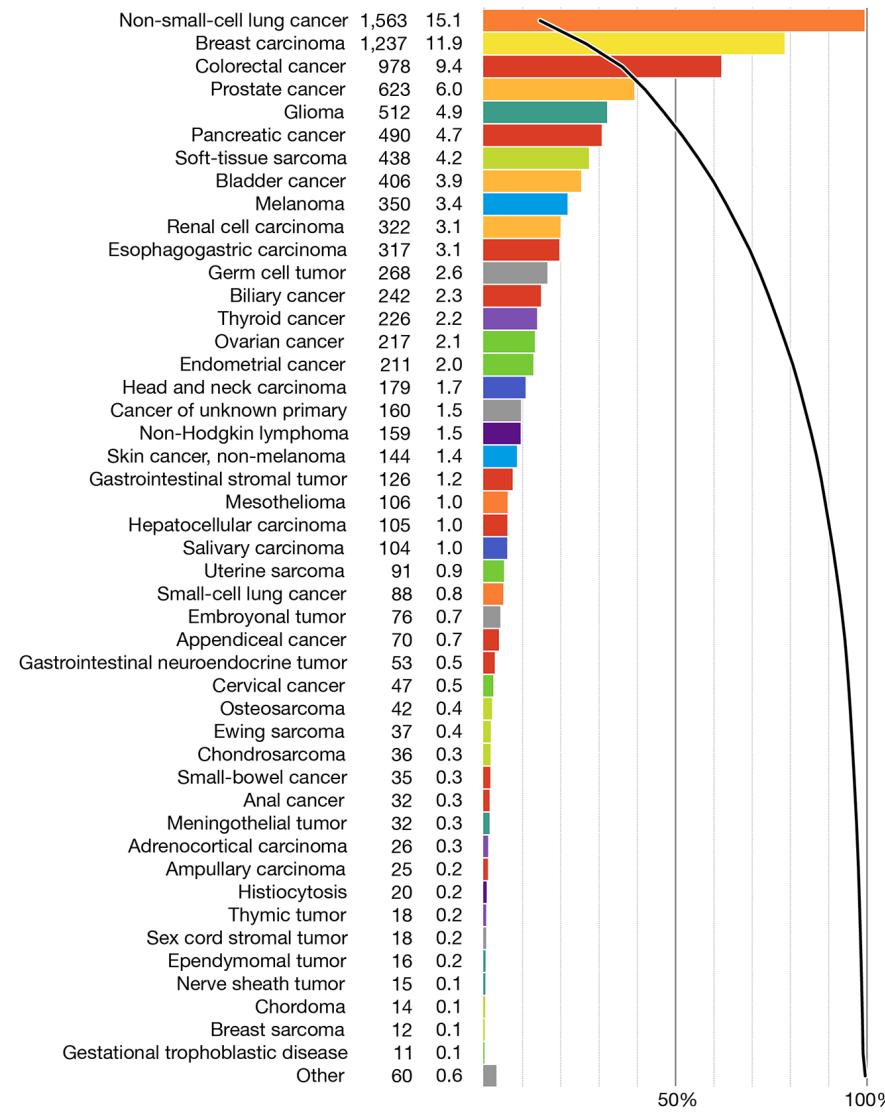

When to not use a pie chart

- Hard to judge proportions
- Poor use of color
- Hard to read labels
- Over ½ of the categories had to be broken out of the pie chart

Ahmet Zehir et al. (2017) Nature Medicine doi:10.1038/nm.4333

Same data with a redesigned approach

Selected articles on fundamentals of data viz

- Visualizing samples with box plots
- Circos plots
- When to use (and not use) pie charts
- Resources for choosing colors
 - <http://colorbrewer2.org/>
 - <http://mkweb.bcgsc.ca/color/>
 - Understanding and using Color Palettes
 - Color palettes for color blindness
 - Names for >9000 colors
 - Including 40 beer colors
- Credit to Martin Krzywinski for his extensive work in this area and many of the above resources

Best practices in visualization

Best practices from this workshop

- *Always* label axes
- Consider readability of font size
- Avoid vertical or angled text if possible
- Avoid unnecessary use of color, point shapes, etc.
- Choose colors wisely
- If individual data points are being plotted and have started to really pile up on top of each other consider using a density function
- Always be transparent about what data manipulation is taking place (e.g. log scale, filtering of outliers, etc.)

Best practices from the experts

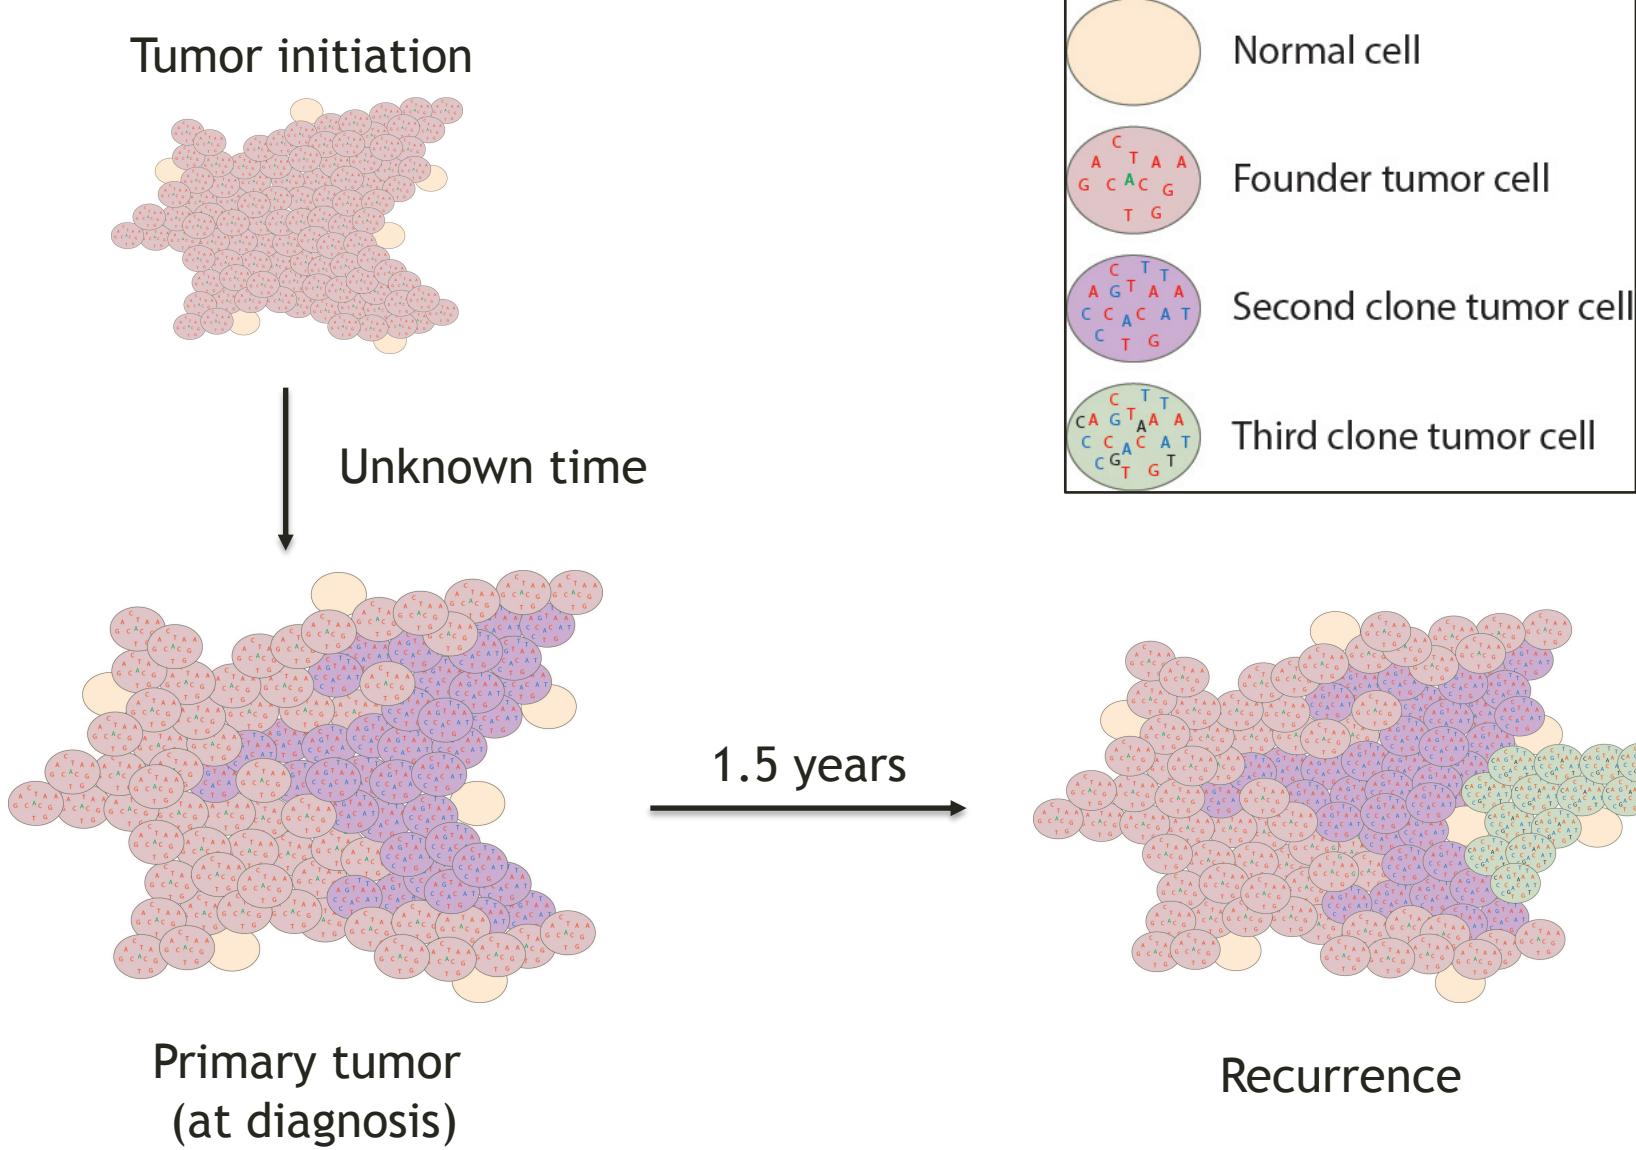

Ten Simple Rules for Better Figures (Rougier et al. 2014):

Scientific visualizations should act as a “a graphical interface between people and data”. Try to follow these rules.

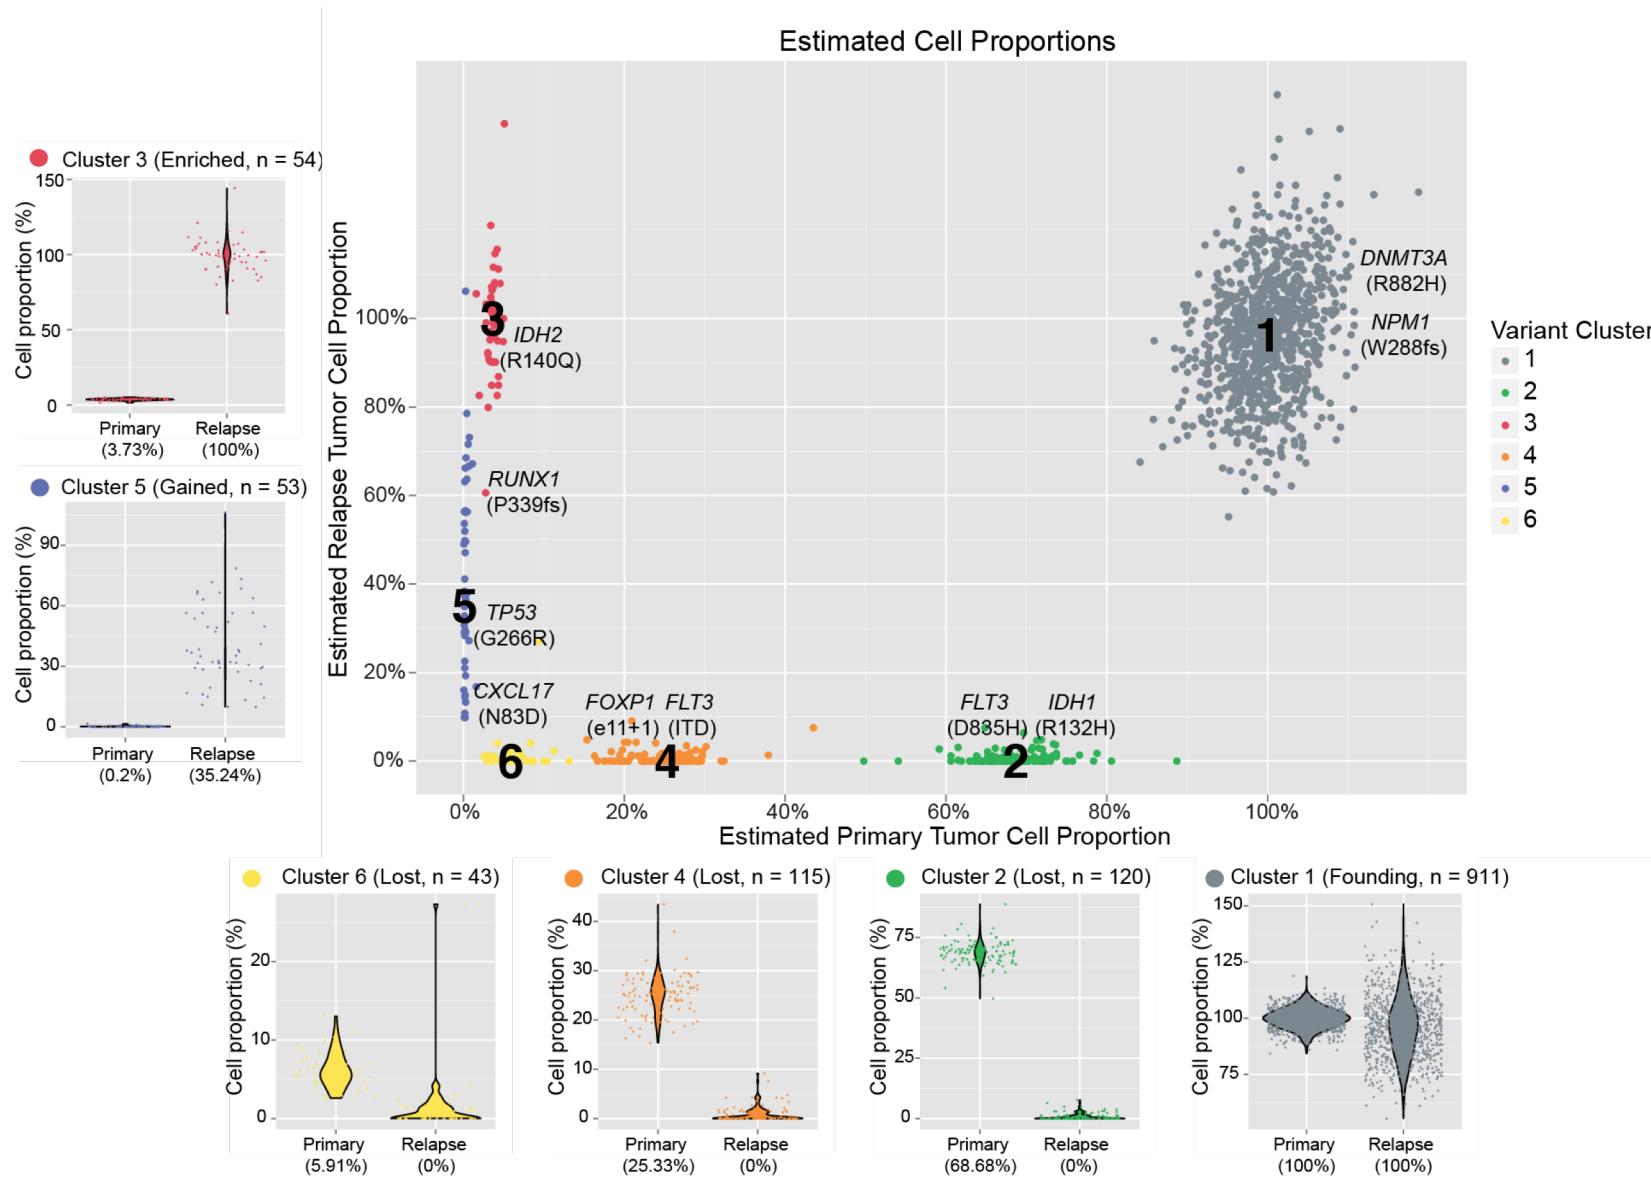

1. Know Your Audience
2. Identify Your Message
3. Adapt the Figure to the Support Medium
4. Captions Are Not Optional
5. Do Not Trust the Defaults
6. Use Color Effectively
7. Do Not Mislead the Reader
8. Avoid “Chartjunk”
9. Message Trumps Beauty
10. Get the Right Tool

Example visualizations using R

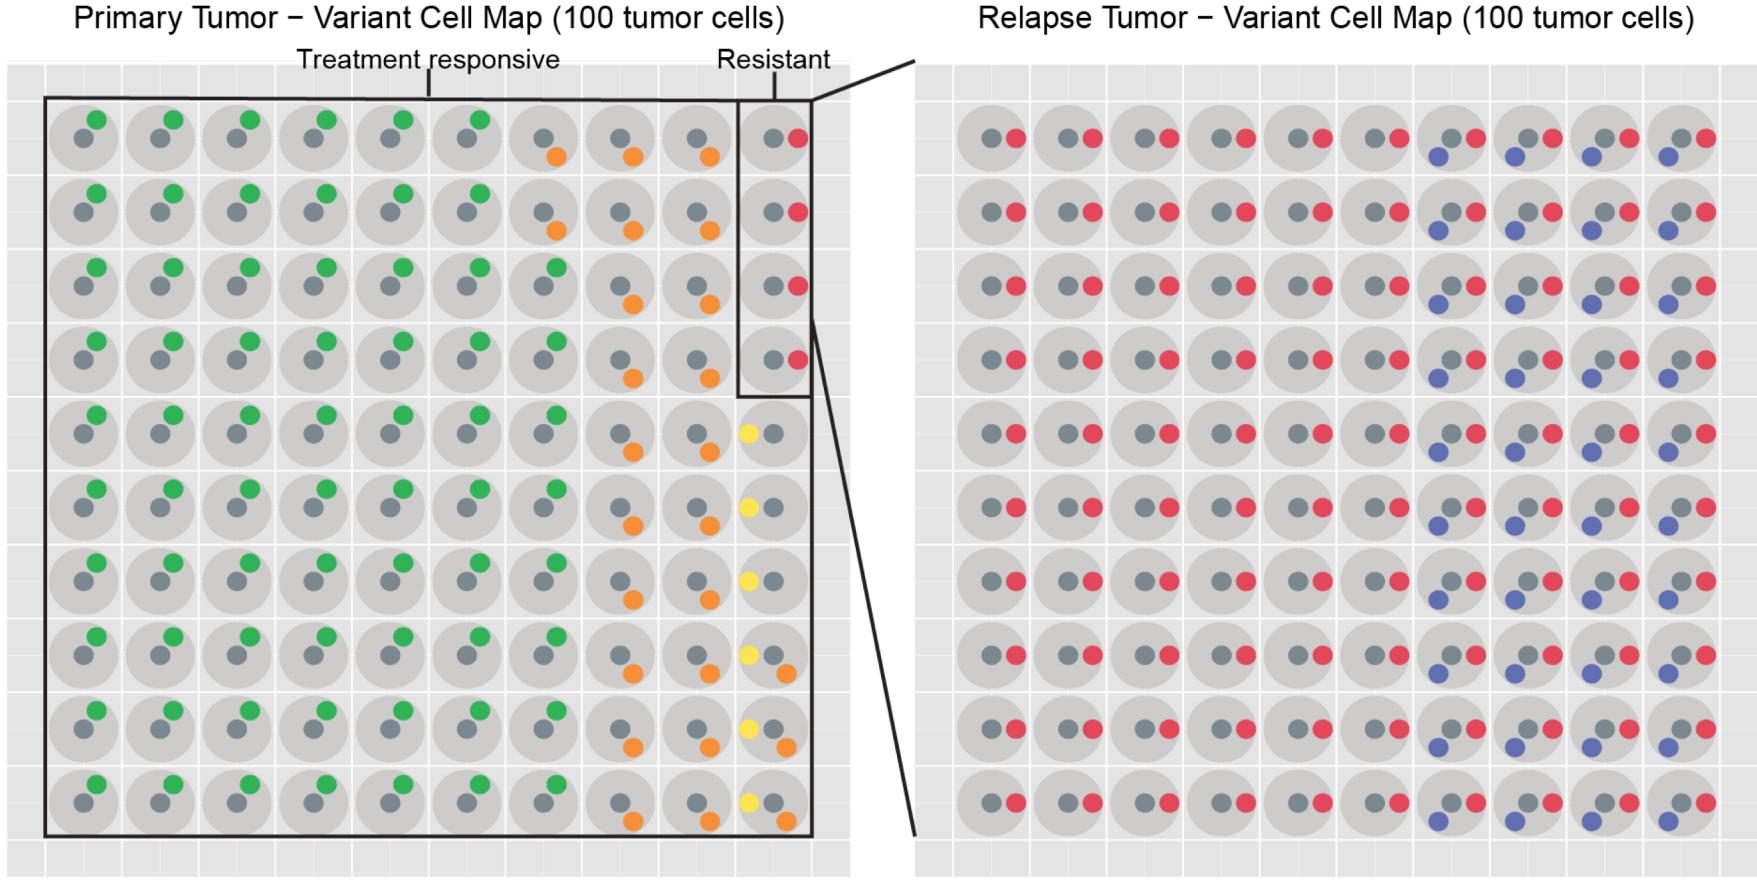

Visualizing tumor evolution

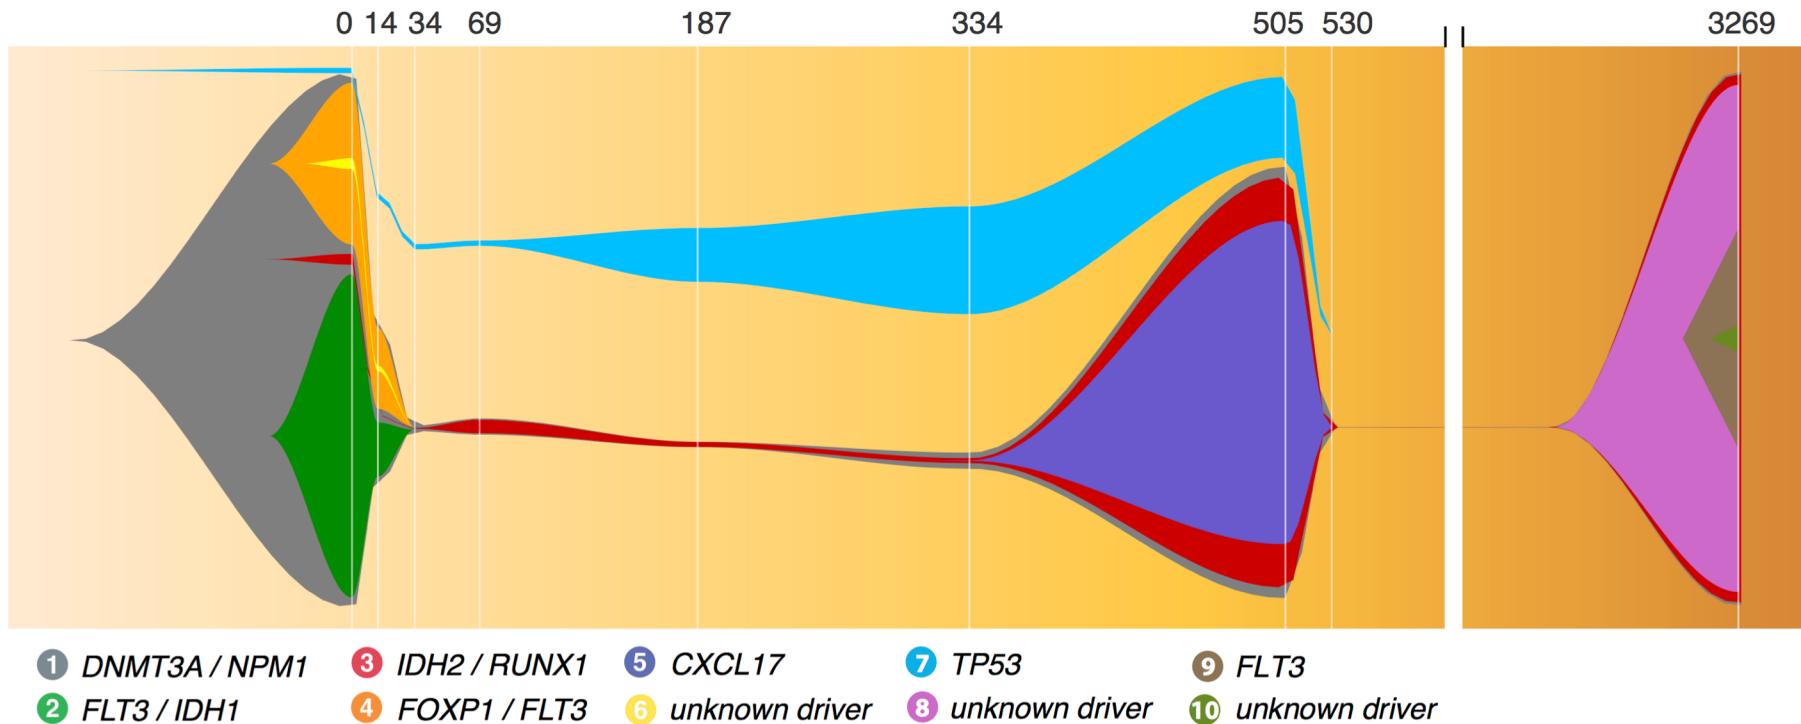

Clustering VAFs to define distinct cell populations

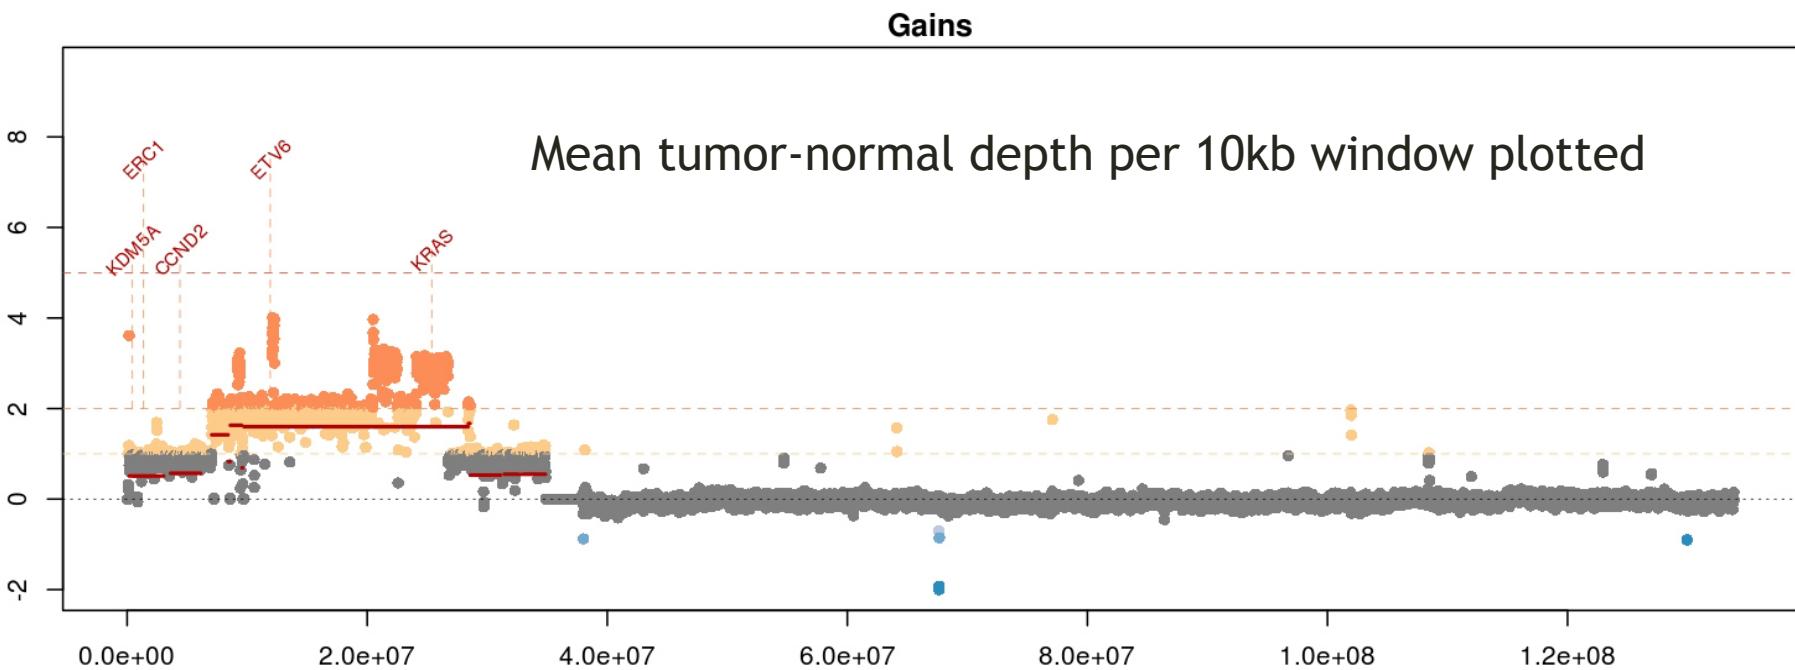

Using a “cell map” to represent the variant clusters in 100 hypothetical cells of a tissue

A ‘fish’ plot is used to represent sub-clones lost and gained over time

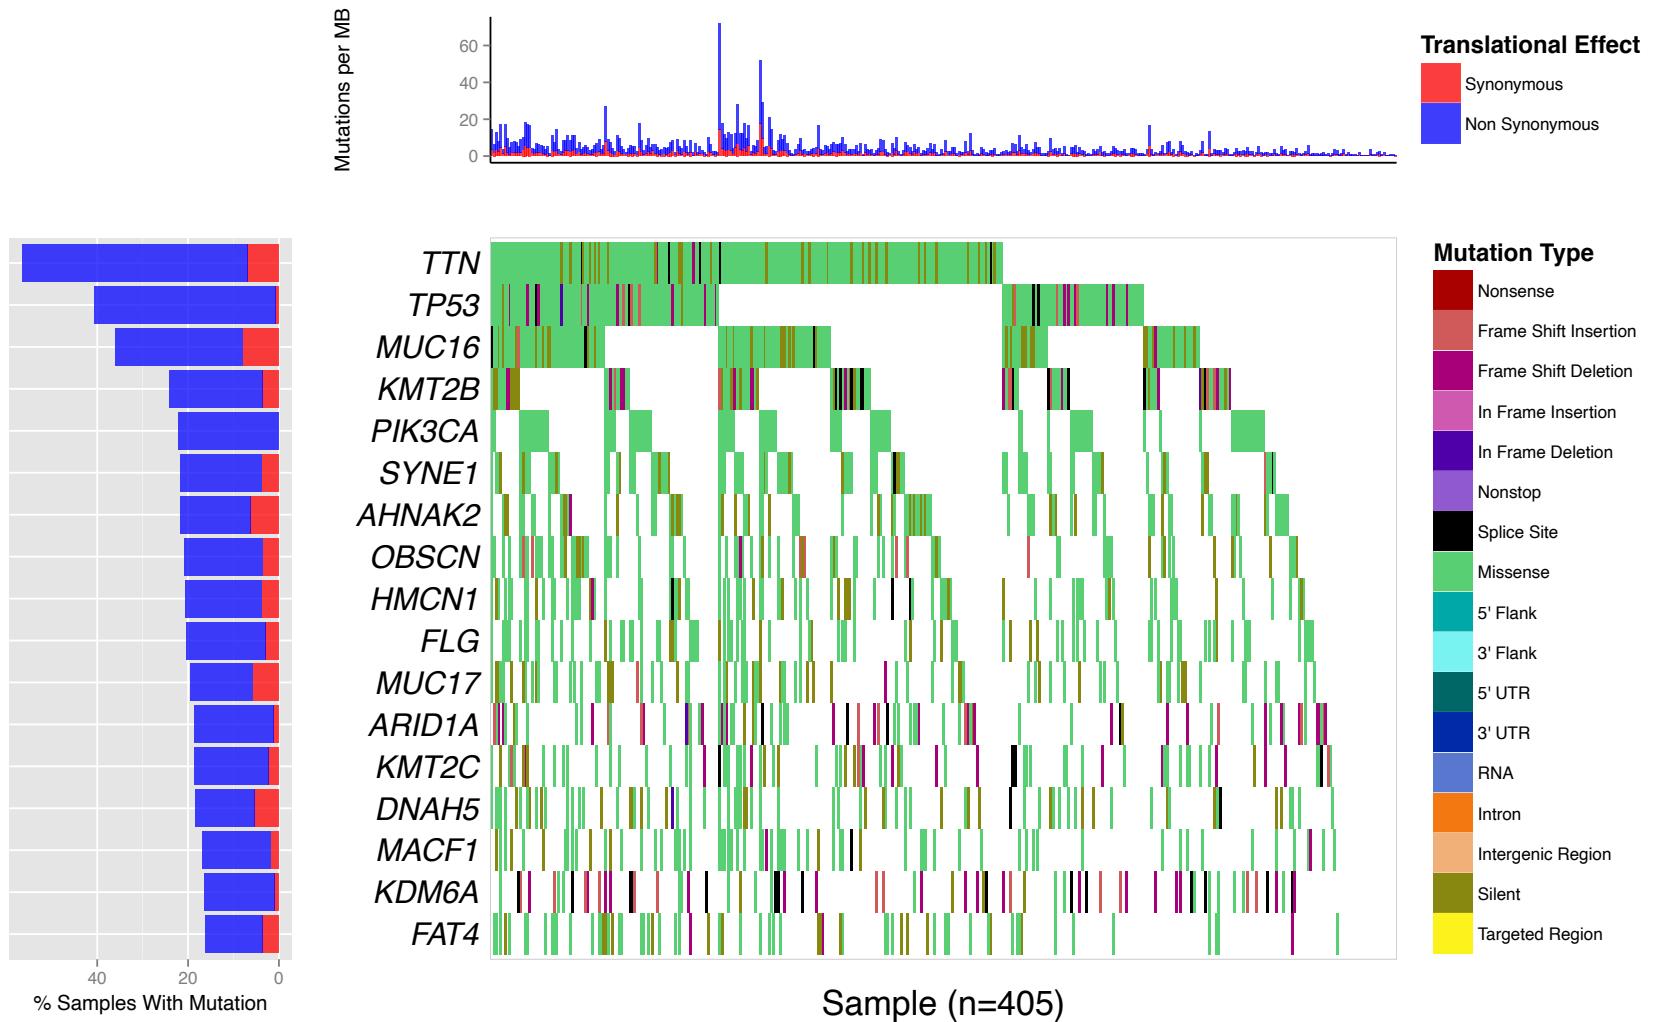

Visualizing copy number variation

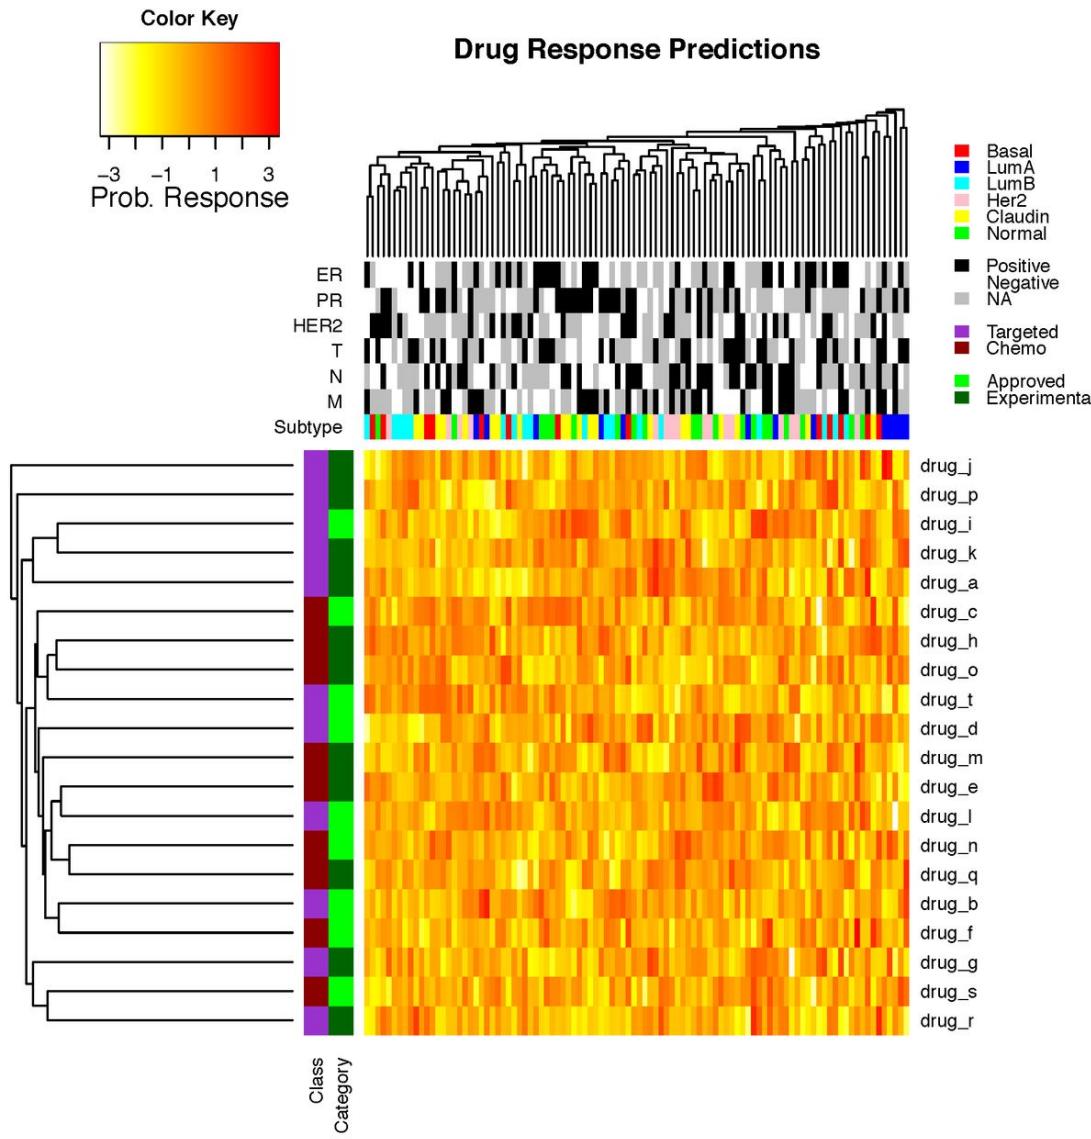

KRAS amplification in a metastatic breast cancer

A ‘waterfall’ plot is one way to visualize the pattern of variant recurrence in a cohort of samples

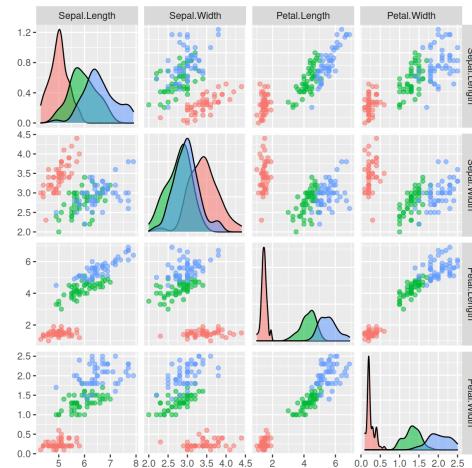

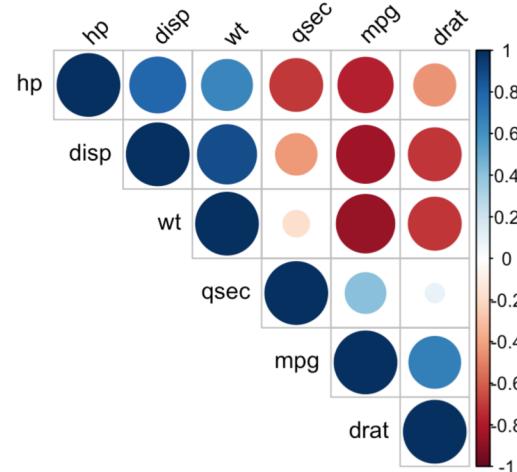

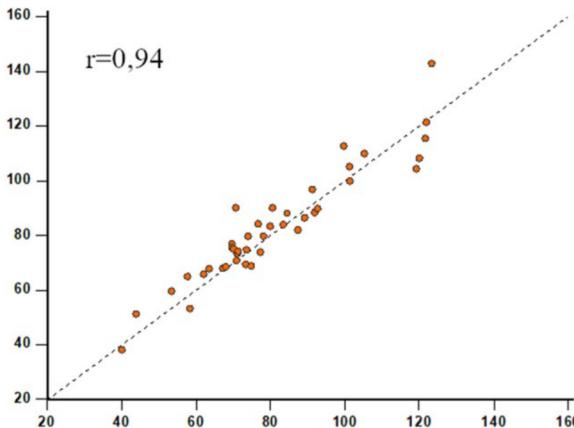

<https://github.com/griffithlab/GenVisR>

Heatmaps are a common way to simultaneously visualize multiple features of a dataset

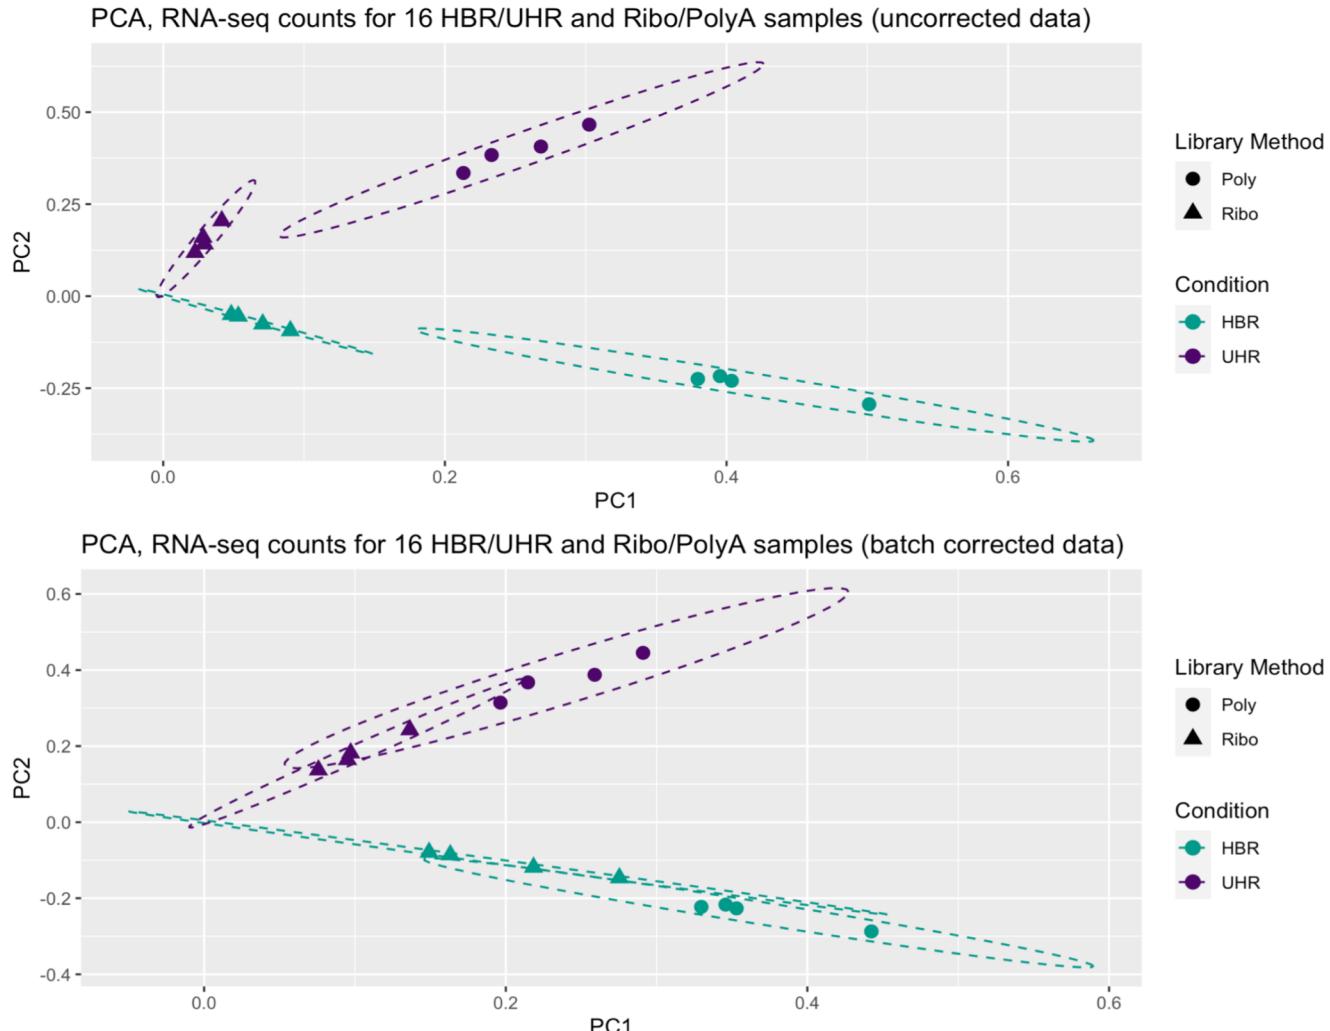

Dimensionality reduction

- “Dimensionality reduction, is the transformation of data from a high-dimensional space into a low-dimensional space so that the low-dimensional representation retains some meaningful properties of the original data”
 - Common approaches: principal component analysis (PCA), linear discriminant analysis (LDA), canonical correlation analysis (CCA), or non-negative matrix factorization (NMF) techniques, clustering by K-nearest neighbors algorithm
 - Used when dealing with large numbers of observations or variables when simpler approaches become unwieldy

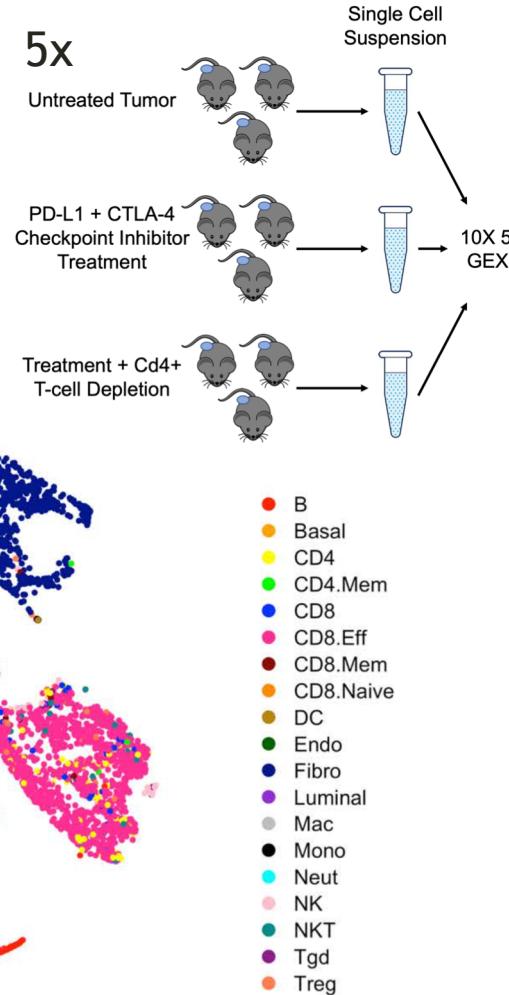

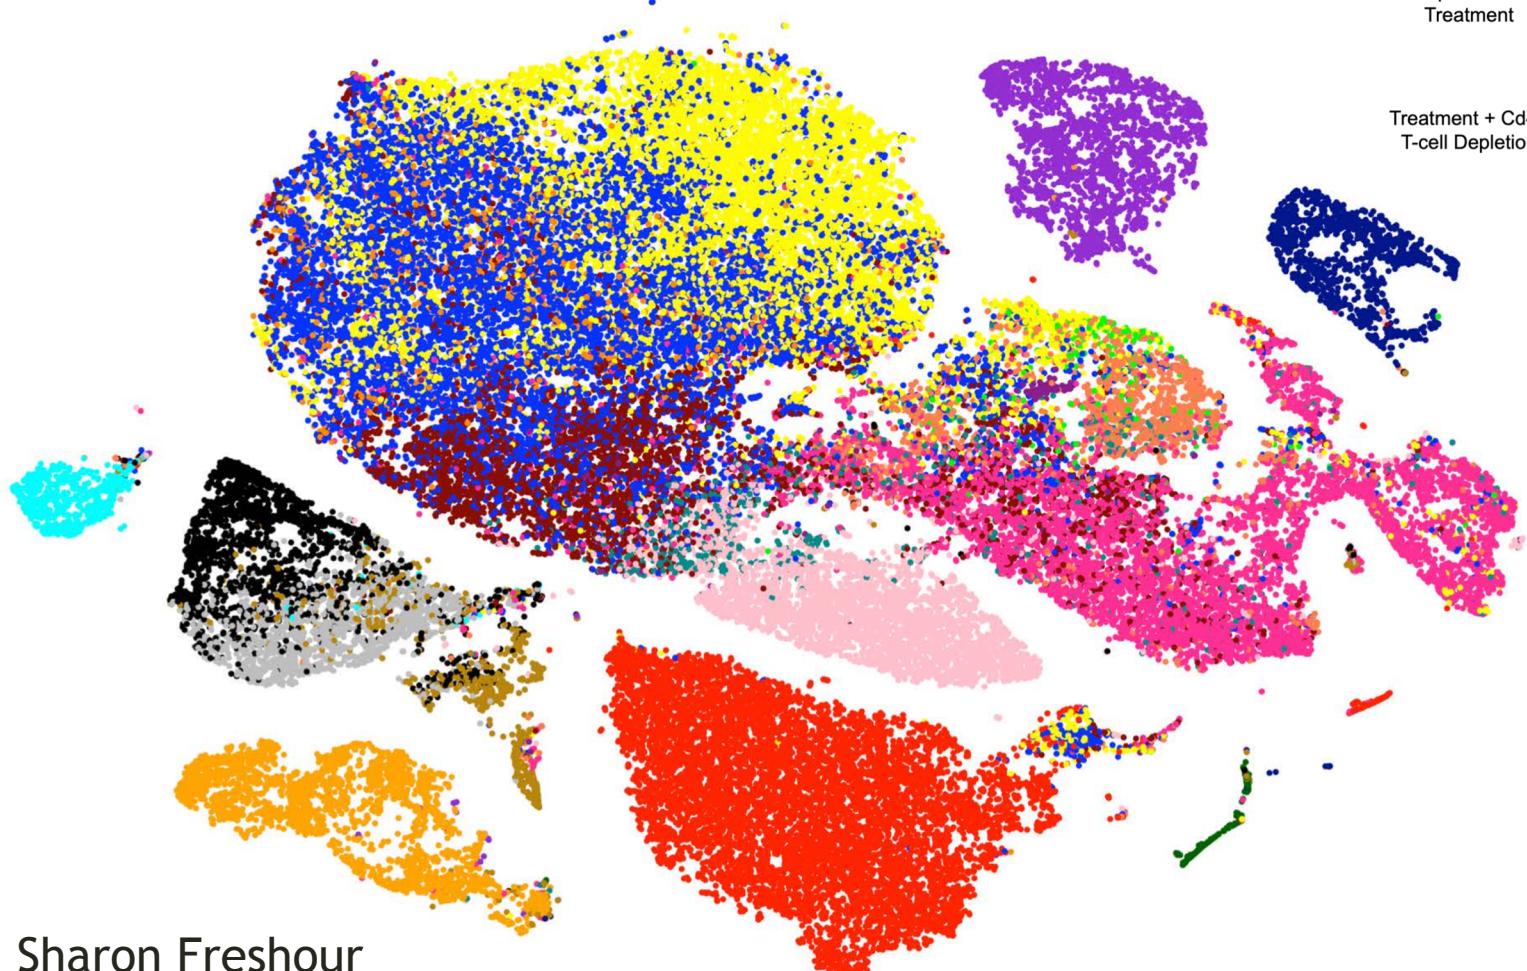

Dimensionality reduction (example - RNA-seq batch effects)

Principal component analysis (PCA) approach to dimensionality reduction applied to 16 bulk RNA-seq data sets. Used to visualize batch effects and batch correction

Dimensionality reduction (example - scRNA)

t-SNE approach (PCA) to dimensionality reduction applied to visualize gene expression patterns from >60,000 cells

Dimensionality reduction (example - scRNA)

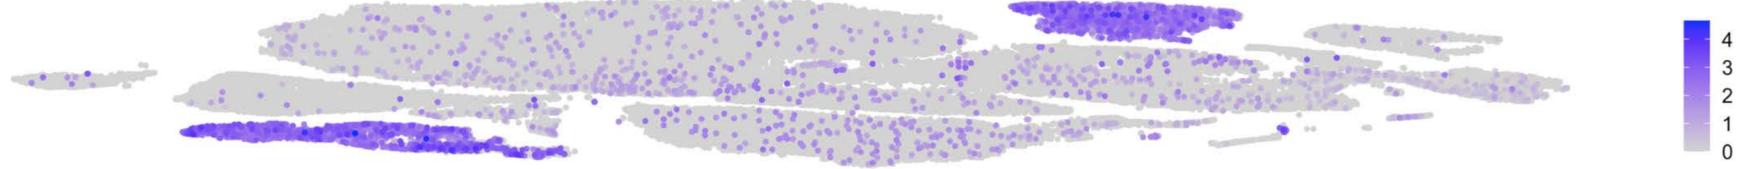

A

Tumor status based on variant detection

B

Epcam expression

C

Epithelial cell typing

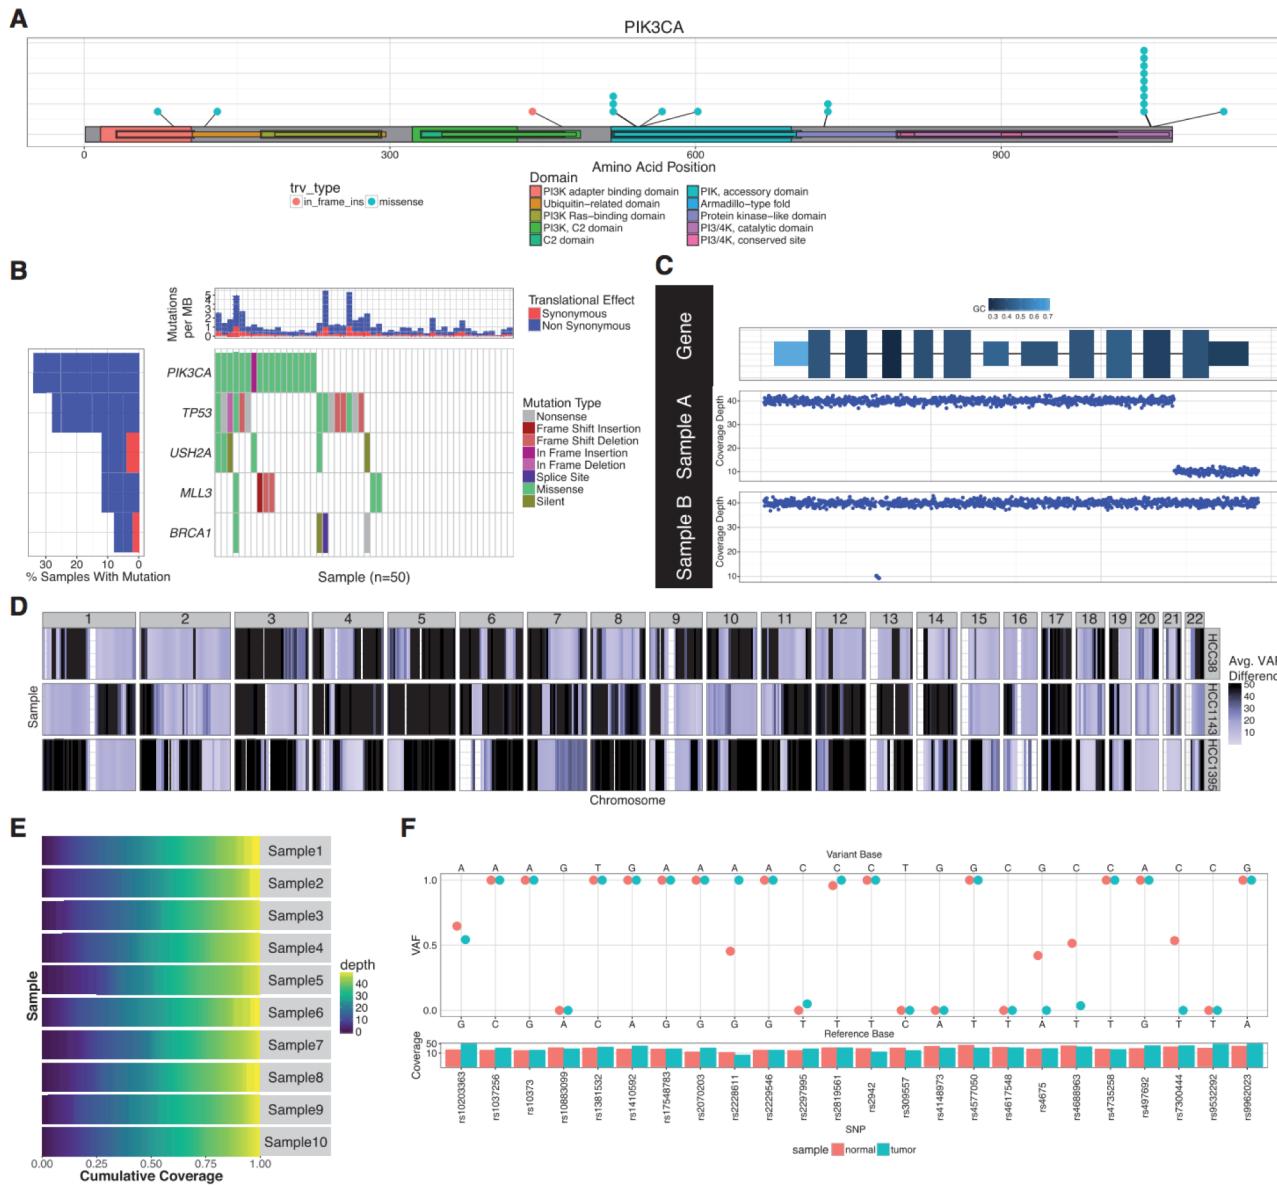

D

Tumor cell subtyping

GenVisR and genviz.org online course were created to help others make common genomic visualizations

Introduction to GenViz course site
